

Ebuka

Individual Team Member Contribution

One of my main contributions to the team was helping keep everyone organized and communicating. I encouraged the group to meet and set up a Zoom meeting so we could discuss

the project, clarify what needed to be completed, and make sure everyone understood the main topics we needed to cover. I also created the GitHub link that we used to upload and share our work.

One of the biggest challenges we faced was learning how to properly upload files and manage our documents through GitHub. At first, the process was confusing and caused some difficulty for the team, but we worked through the problems together. We shared what we were learning, helped each other troubleshoot, and eventually became more comfortable with the process.

This

experience showed me the importance of communication, teamwork, and patience when working

through unfamiliar technical tasks. It also helped me see that even when a group runs into problems, working together and sharing responsibility can lead to a successful final result.

Sam

The team and I set up a meeting sat and Sunday to complete the assignment we all worked together to take time to ask questions and brainstorm and complete all tasks and journals

Project: Module 02 Lab Exercise

Contribution Summary

I contributed to the Module 02 lab by completing and checking the required notebook work. I worked

through the setup and data-analysis sections, verified that the Python libraries imported successfully,

loaded and explored the Iris dataset, converted the data into a pandas DataFrame, and reviewed the resulting outputs.

I also completed the numerical analysis and visualization tasks. This included calculating the mean and

standard deviation of sepal length, creating the species-count bar chart, and reviewing the scatter plot to

identify patterns among the three Iris species. I checked the outputs after running the cells to make sure

the calculations and visualizations displayed correctly.

For the documentation portion, I completed the analysis and reflection section in the notebook. I recorded

the dataset size, number of features, number of classes, observations from the visualization, questions for

further investigation, and a short reflection about pandas, NumPy, and matplotlib.

Skills Practiced

- Python notebook execution and verification
- pandas DataFrame organization and grouping
- NumPy numerical calculations
- matplotlib data visualization
- Markdown documentation and reflection
- Basic GitHub project organization

Contribution Reflection

Completing these parts of the project helped me become more comfortable working through a machine

learning notebook systematically. I learned to check outputs after each step and use visualizations and

numerical results together when analyzing data. The experience also showed me how documentation and

version control are part of completing a machine learning project, not separate from the technical work.

Cersidy

Individual Contribution Summary

I contributed to the project by:

- Initializing the GitHub repository.
- Completing the Module 2 machine-learning lab.
- Working with environment setup, dataset exploration, basic data operations, and visualization.
- Uploading the completed lab, reflective journal, and individual contribution report.
- Correcting and replacing an earlier version of my lab submission.
- Removing obsolete placeholder files to keep the repository organized.

Overall, I made 7 commits and helped establish the repository, complete the technical lab work, document my learning, and maintain the quality of the submitted materials.
